

GEO Audit Tool – Complete Check List & Requirements

A comprehensive checklist to evaluate a website's Generative Engine Optimization (GEO) readiness.

Priority Legend

- **Critical** – Add in V1
 - **High** – Add in V1.2
 - **Medium** – Future Roadmap
-

1. Technical Crawlability — Critical

- **llms.txt file detection** — Check if llms.txt exists and is properly structured; this is an emerging standard for telling LLMs which pages to use.
 - **robots.txt AI crawler directives** — Check if GPTBot, ClaudeBot, PerplexityBot, Google-Extended, and CCBot are allowed or blocked.
 - **XML sitemap presence and freshness** — Sitemap is critical for AI crawlers to discover all indexable content systematically.
 - **Page render type: static vs JS** — Many AI bots cannot execute JavaScript; SSR/SSG pages are significantly more crawlable than CSR pages.
 - **TTFB / Time to First Byte** — AI crawlers have short fetch timeouts; slow TTFB can lead to incomplete or missed crawls.
 - **Canonical tag check** — Duplicate content without canonicals can confuse AI models about which page is authoritative.
-

2. Schema Markup Depth — Critical

- **Organization schema completeness** — Check for name, URL, logo, sameAs social profiles, contactPoint, foundingDate, areaServed, and numberOfEmployees.
- **FAQPage schema JSON-LD** — FAQ content should have valid FAQPage JSON-LD; critical for AI citation and answer extraction.
- **Service schema per service page** — ServiceType, provider, areaServed, and offers should be marked up on each service page for AI entity mapping.
- **Person / Author schema on blog pages** — Author entity markup with credentials boosts E-E-A-T signals used by AI for citation confidence.
- **BreadcrumbList schema** — Helps AI systems map site hierarchy and understand content relationships.
- **HowTo / Article / WebPage schema** — Content-type schema makes pages eligible for AI Overview selection and featured snippet extraction.

- **Schema validation errors/warnings** — Run schema through validation tools to flag missing or malformed required fields.
-

3. Entity & Knowledge Graph Optimization — Critical

- **Brand name density on page** — Check whether the brand name appears naturally in the opening paragraph, H1, and conclusion.
 - **SameAs / external entity links** — Links to LinkedIn, Crunchbase, YouTube, Clutch, and other profiles reinforce brand entity in the LLM knowledge graph.
 - **NAP consistency check** — Name, address, and phone must match across the page, schema, and detectable citations elsewhere.
 - **Co-citation detection** — Check whether the brand is mentioned alongside established industry entities; co-citation signals authority to LLMs.
 - **Knowledge Panel eligibility signals** — Structured data, Wikipedia/Wikidata links, and consistent entity mentions support Knowledge Panel and AI citation readiness.
-

4. Content Extractability & Answer Readiness — High

- **Content block structure** — Check if content is divided into clear H2/H3 sections, short paragraphs, and scannable blocks.
 - **Summary / TLDR presence** — A summary at the top helps LLMs quickly understand the page.
 - **Direct answer availability** — Detect whether the page provides direct answers to common questions.
 - **FAQ / Q&A formatting** — Questions and answers are properly formatted for easy extraction.
 - **List / bullet usage** — Bullets and numbered lists help AI extract information accurately.
 - **Table / chart usage** — Data presented in tables/charts is easier for LLMs to parse and cite.
 - **Relevant internal linking** — Strong internal links help AI understand topical clusters and context.
-

5. Evidence Strength & Trust Signals — High

- **Testimonials / reviews** — Testimonial or review content should be detected on the page.
 - **Case studies / proof of results** — Case studies, reports, and measurable results improve citation confidence.
 - **About / team transparency** — About/team content and dedicated pages increase trust and E-E-A-T strength.
 - **Trust badges / certifications** — Awards, partners, certifications, and compliance badges strengthen credibility.
 - **Contact transparency** — Clear contact details, company information, and support channels improve trust.
 - **Author credibility** — Author bio, credentials, experience, or expertise should be visible.
 - **Source citations** — External references and sources should be linked for claims or statistics.
-

6. Content Quality & LLM Readability — High

- **Statistics / data density** — AI engines prioritize citing specific numbers, benchmarks, and dated research findings.
 - **Quotable sentence detection** — Scan for standalone citable facts, e.g., “X does Y, resulting in Z.”
 - **Content freshness / last updated date** — AI engines favor recently updated content; check for visible publish/update date and DateModified in schema.
 - **Reading level / clarity score** — Clear mid-complexity content is easier for AI models to extract than overly dense or overly casual writing.
 - **Conversational query match** — Check whether page content mirrors how users phrase questions to ChatGPT, Perplexity, Gemini, or Claude.
 - **Semantic keyword coverage** — Check whether topically related entity terms are present; LLMs use semantic clustering, not just exact keywords.
-

7. Off-Page & Citation Authority — High

- **Third-party mention / citation check** — Check if the brand is mentioned on high-authority domains such as Forbes, G2, Clutch, or industry blogs.
 - **Social profile completeness** — LinkedIn, YouTube, X/Twitter, and industry directories strengthen AI entity profiles.
 - **Review platform presence** — G2, Clutch, Trustpilot, and Google Business Reviews are heavily weighted third-party trust signals.
 - **Backlink quality for AI authority** — Not just link count; links from .edu, .gov, or high-DA industry publications directly influence LLM training and sourcing.
 - **Press / media mentions detection** — PR coverage on news sites is a strong LLM citation trust signal and should be flagged.
-

8. Traditional SEO Foundation — High

- **Meta title & description audit** — Check character count, keyword inclusion, uniqueness, and relevance.
 - **Core Web Vitals: LCP, INP, CLS** — Google’s INP replaced FID in 2024; poor CWV scores reduce Google AI Overview eligibility.
 - **Mobile-friendliness check** — AI crawlers and Google SGE both weight mobile-optimized pages higher for extraction.
 - **Internal linking structure** — Strong internal links help AI understand topical authority clusters and content hierarchy.
 - **Broken links / redirect chains** — Broken links signal low-quality maintenance to both crawlers and AI citation systems.
-

9. AI Platform Visibility / Live Testing — Medium / Phase 2

- **Live prompt testing across LLMs** — Query ChatGPT, Perplexity, Gemini, and Claude with brand-relevant prompts and check if the site is cited or mentioned.
 - **Sentiment in AI-generated answers** — When the brand is mentioned by AI, check whether the sentiment is positive, neutral, or negative.
 - **Competitor citation comparison** — Check who is being cited instead and compare visibility gaps against 3–5 competitors for the same queries.
 - **AI traffic detection in GA4** — Track referral traffic from ChatGPT, Perplexity, Bing Copilot, and similar AI sources.
-

10. UX / Report-Level Improvements — High

- **Multi-page audit, not just homepage** — Current MVP audits one URL; service pages, blog posts, About pages, and case studies need separate GEO scores.
 - **Prioritized fix roadmap with effort tags** — Every failed check should show estimated effort: Quick Win, Medium, or Complex.
 - **Exportable PDF/CSV report** — Lead magnet value increases significantly if users can share or save a branded report.
 - **Re-audit / score tracking over time** — Allow users to re-run audits and track score improvement.
 - **Competitor benchmark comparison** — Audit a competitor URL alongside the user's URL and show a side-by-side score gap.
-

Scoring Model Recommendation

Score each category out of 100.

Suggested Weightage

- Crawlability — 20%
 - Schema — 20%
 - Entity Clarity — 15%
 - Content Extractability — 15%
 - Evidence Strength — 15%
 - Content Quality & Freshness — 10%
 - Off-Page Authority — 5%
-

Final Note for Development Team

The goal of this tool is not traditional SEO audit only. The goal is to measure how well a website can be understood, extracted, and cited by AI engines such as ChatGPT, Perplexity, Gemini, Claude, and Google AI Overviews.

Priority should be: crawlability, schema, entity clarity, content extractability, evidence strength, freshness, and off-site authority.
